SingleThreadTCPServer (versión Java)

This is a simple (application) framework to build TCP Servers

To Run This Code:

1. Compile the framework and both examples (VoidServer and EchoServer) from a terminal:

```
javac EchoServer.java VoidServer.java SingleThreadTCPServer.java
```

2. Run the compiled example class:

```
java VoidServer <porNumber>
```

or

```
java EchoServer <porNumber>
```

To Test with a Client (e.g., netcat):

1. Open a terminal and run the server.

```
nc server_ip_addres <portNumber>
```

2. Type some text in the netcat terminal and press Enter. You should see the server echo it back.
3. To disconnect the client enter an empty message
